**Media Statement**

Freese and Nichols has been honored to participate in the City of Fort Worth's bridge project supporting the Trinity River Vision program. We designed the three bridges using a V-Pier concept that has been successful all over the world. This design meets the city's objective to create signature elements that preserve a scenic view of the river.

We have full confidence in our design of the bridges. Multiple independent reviewers have confirmed the suitability, structural integrity and constructability of the design. As further verification, a test mock-up of the V-Pier demonstrated that the bridges can be constructed as designed.

Minor design clarifications are typical on complex projects, and Freese and Nichols has promptly addressed issues within our control as we have become aware of them.

Over our 125 years of working for the City of Fort Worth, Freese and Nichols has designed award-winning bridges such as the Clearfork Main Street Bridge and the Phyllis J. Tilley Memorial Pedestrian Bridge. We value our relationship with the city and others involved in Trinity River Vision, and we look forward to the project's completion and to providing services for the community for decades to come.
